

# Surgical Treatments

## Surgery for Prolapse

Surgical treatments for prolapse aim to lift the prolapsed organ back into place or repair/remove the prolapsed organ altogether. They include:

- Anterior colporrhaphy - can be done under local anaesthetic as an outpatient procedure
- Posterior colporrhaphy
- Enterocele repair
- Perineorrhaphy
- Hysterectomy with or without Colporrhaphy/Perineorrhaphy
- Uterus/cervix suspension/fixation (laparoscopic hysteropexy)
- Vaginal vault suspension/fixation (sacrospinous fixation or laparoscopic sacrocolpopexy)

## Surgical treatments anterior repair and posterior repair

## Post-Operative Care

Patients will normally need a catheter overnight and 1/2 day stay in hospital followed by 6-8 weeks of gradual recovery depending on the extent of surgery.
